**Time to Get Right**

**Right Triangle Congruence Theorems**

**Vocabulary**

Choose the diagram that models each right triangle congruence theorem.

1. Hypotenuse-Leg (HL) Congruence Theorem
   - Hypotenuse-Leg (HL) Congruence Theorem
   - Hypotenuse-Leg (HL) Congruence Theorem
   - Hypotenuse-Leg (HL) Congruence Theorem

2. Leg-Leg (LL) Congruence Theorem
   - Leg-Leg (LL) Congruence Theorem
   - Leg-Leg (LL) Congruence Theorem

3. Hypotenuse-Angle (HA) Congruence Theorem
   - Hypotenuse-Angle (HA) Congruence Theorem

4. Leg-Angle (LA) Congruence Theorem
   - Leg-Angle (LA) Congruence Theorem
Problem Set

Mark the appropriate sides to make each congruence statement true by the Hypotenuse-Leg Congruence Theorem.

1. \( \triangle DPR \cong \triangle QFM \)

2. \( \triangle ACI \cong \triangle GCE \)

3. \( \triangle QTR \cong \triangle SRT \)

4. \( \triangle ADG \cong \triangle HKN \)

Mark the appropriate sides to make each congruence statement true by the Leg-Leg Congruence Theorem.

5. \( \triangle BZN \cong \triangle TGC \)

6. \( \triangle MNO \cong \triangle QPO \)

7. \( \triangle PZT \cong \triangle PZX \)

8. \( \triangle EGI \cong \triangle ONQ \)
Mark the appropriate sides and angles to make each congruence statement true by the Hypotenuse-Angle Congruence Theorem.

9. \( \triangle SVM \cong \triangle JFW \)

10. \( \triangle MSN \cong \triangle QRT \)

11. \( \triangle IEG \cong \triangle IEK \)

12. \( \triangle DCB \cong \triangle ZYX \)

Mark the appropriate sides and angles to make each congruence statement true by the Leg-Angle Congruence Theorem.

13. \( \triangle XTD \cong \triangle HPR \)

14. \( \triangle SEC \cong \triangle PEC \)
15. $\triangle PBJ \cong \triangle OTN$

16. $\triangle AXT \cong \triangle YBU$

For each figure, determine if there is enough information to prove that the two triangles are congruent. If so, name the congruence theorem used.

17. Given: $GF$ bisects $\angle RGS$, and $\angle R$ and $\angle S$ are right angles.
   Is $\triangle FRG \cong \triangle FSG$?

18. Given: $DV \perp TU$
   Is $\triangle DVT \cong \triangle DVU$?

Yes. There is enough information to conclude that $\triangle FRG \cong \triangle FSG$ by HA.

No. $\triangle DVT$ might not be congruent to $\triangle DVU$. There is not enough information.

19. Given: $NM \equiv EM$, $DM \equiv OM$, and $\angle NMD$ and $\angle EMO$ are right angles.
   Is $\triangle NMD \cong \triangle EMO$?

20. Given: $RP \equiv QS$, and $\angle R$ and $\angle Q$ are right angles.
   Is $\triangle SRP \cong \triangle PQS$?

Yes. There is enough information to conclude that $\triangle NMD \cong \triangle EMO$ by LL.

Yes. There is enough information to conclude that $\triangle SRP \cong \triangle PQS$ by HL.
### Lesson 6.1 Skills Practice

Name ___________________________ Date _____________

21. Given: $\triangle GEO \cong \triangle MKI$, and $\angle E$ and $\angle K$ are right angles.
   Is $\triangle GEO \cong \triangle MKI$?

   ![Diagram with points G, O, E, M, K, I]

   No. $\triangle GEO$ might not be congruent to $\triangle MKI$. There is not enough information.

22. Given: $\triangle GHM \cong \triangle UVM$, and $\angle H$ and $\angle V$ are right angles.
   Is $\triangle GHM \cong \triangle UVM$?

   ![Diagram with points G, H, M, V, U]

   Yes. There is enough information to conclude that $\triangle GHM \cong \triangle UVM$ by LA.

Use the given information to answer each question.

23. Two friends are meeting at the library. Maria leaves her house and walks north on Elm Street and then east on Main Street to reach the library. Paula leaves her house and walks south on Park Avenue and then west on Main Street to reach the library. Maria walks the same distance on Elm Street as Paula walks on Main Street, and she walks the same distance on Main Street as Paula walks on Park Avenue. Is there enough information to determine whether Maria’s walking distance is the same as Paula’s walking distance?

   ![Diagram showing Maria’s and Paula’s paths]

   Yes. Maria’s walking distance to the library is equal to Paula’s walking distance. The triangles formed are right triangles. The corresponding legs of the triangles are congruent. So, by the Leg-Leg Congruence Theorem, the triangles are congruent. If the triangles are congruent, the hypotenuses are congruent.
24. An auto dealership displays one of their cars by driving it up a ramp onto a display platform. Later they will drive the car off the platform using a ramp on the opposite side. Both ramps form a right triangle with the ground and the platform. Is there enough information to determine whether the two ramps have the same length? Explain.

No. There is not enough information to determine whether the two ramps have the same length. The triangles formed by the ramps, the vertical sides of the platform, and the ground are right triangles. But, the lengths of the legs, the lengths of the hypotenuses, and the measures of the acute angles are unknown.

25. A radio station erected a new transmission antenna to provide its listeners with better reception. The antenna was built perpendicular to the ground, and to keep the antenna from swaying in the wind two guy wires were attached from it to the ground on opposite sides of the antenna. Is there enough information to determine if the guy wires have the same length? Explain.

No. There is not enough information to determine whether the guy wires have the same length. The triangles formed by the antenna, the guy wires, and the ground are right triangles. But, the lengths of the legs, the lengths of the hypotenuses, and the measures of the acute angles are unknown.
26. Two ladders resting on level ground are leaning against the side of a house. The bottom of each ladder is exactly 2.5 feet directly out from the base of the house. The point at which each ladder rests against the house is 10 feet directly above the base of the house. Is there enough information to determine whether the two ladders have the same length? Explain.

Yes. The triangles formed by the ladders, the ground, and the side of the house are right triangles. Each leg of one triangle is congruent to the corresponding leg of the other triangle, making the two triangles congruent by LL. The ladders form the hypotenuses of the triangles. Since the triangles are congruent, the hypotenuses are congruent. Therefore, the ladders have the same length.

Create a two-column proof to prove each statement.

27. Given: \( WZ \) bisects \( YV \), \( WV \perp VY \), and \( YZ \perp YY \)

Prove: \( \triangle WVX \cong \triangle ZYX \)

**CPCTC**
*Corresponding Parts of Congruent Triangles are Congruent*

**Vocabulary**
Provide an example to illustrate each term.

1. **Corresponding parts of congruent triangles are congruent (CPCTC)**
   
   **Examples will vary.**
   
   **Given:** \( \triangle AFH \cong \triangle PST \)
   
   The corresponding congruent parts are:
   
   \( \angle A \cong \angle P, \angle F \cong \angle S, \angle H \cong \angle T, \)
   
   \( AF \cong PS, FH \cong ST, HA \cong TP \)

2. **Isosceles Triangle Base Angle Theorem**

   **Examples will vary.**
   
   **Given:** \( \triangle FND \text{ with } FN \cong FD \)
   
   The Isosceles Triangle Base Angle Theorem states that \( \angle N \cong \angle D \).

3. **Isosceles Triangle Base Angle Converse Theorem**

   **Examples will vary.**
   
   **Given:** \( \triangle RCQ \text{ with } \angle R \cong \angle C \)
   
   The Isosceles Triangle Base Angle Converse Theorem states that \( QC \cong QR \).
Problem Set
Create a two-column proof to prove each statement.

1. Given: \(RS\) is the \(\perp\) bisector of \(PQ\).
   Prove: \(\angle SPT \equiv \angle SQT\)

   **Statements**
   1. \(RS\) is the \(\perp\) bisector of \(PQ\).
   2. \(RS \perp PQ\)
   3. \(\angle PTS\) and \(\angle QTS\) are right angles.
   4. \(\triangle PTS\) and \(\triangle QTS\) are right triangles.
   5. \(RS\) bisects \(PQ\)
   6. \(PT \equiv QT\)
   7. \(TS \equiv TS\)
   8. \(\angle SPT \equiv \angle SQT\)
   9. \(\angle SPT \equiv \angle SQT\)

   **Reasons**
   1. Given
   2. Definition of perpendicular bisector
   3. Definition of perpendicular lines
   4. Definition of right triangles
   5. Definition of perpendicular bisector
   6. Definition of bisect
   7. Reflexive Property of \(\equiv\)

   \end{align*} \]
Use the given information to answer each question.

13. Samantha is hiking through the forest and she comes upon a canyon. She wants to know how wide the canyon is. She measures the distance between points A and B to be 35 feet. Then, she measures the distance between points B and C to be 35 feet. Finally, she measures the distance between points C and D to be 80 feet. How wide is the canyon? Explain.

The canyon is 80 feet wide.

The triangles are congruent by the Leg-Angle Congruence Theorem. Corresponding parts of congruent triangles are congruent, so $CD = AE$.

14. Explain why $m\angle NMO = 20^\circ$.

Using $\triangle QMN$ and the Base Angle Theorem, $m\angle MNO = 60^\circ$. Using $\triangle PMO$ and the Base Angle Theorem, $m\angle POM = 80^\circ$. Since $\angle POM$ and $\angle MON$ are supplementary, $m\angle MON = 100^\circ$. Since the sum of the measures of the angles in a triangle is $180^\circ$, $m\angle NMO = 20^\circ$.

15. Calculate $MR$ given that the perimeter of $\triangle HMR$ is 60 centimeters.

$MR = 20$ cm. Using the Base Angle Converse Theorem, $MR = HR$. Solve the perimeter equation $x + x + 20 = 60$, where $x = MR$ and $x = HR$. So, $x = 20$. 
16. Greta has a summer home on Lake Winnie. Using the diagram, how wide is Lake Winnie?

Lake Winnie is 80 feet wide. The triangles are congruent by the Hypotenuse-Leg Congruence Theorem and corresponding parts of congruent triangles are congruent, so the width of Lake Winnie is equal to the length of the 48 meter leg of the triangle that is displayed below the lake.

17. Jill is building a livestock pen in the shape of a triangle. She is using one side of a barn for one of the sides of her pen and has already placed posts in the ground at points A, B, and C, as shown in the diagram. If she places fence posts every 10 feet, how many more posts does she need? Note: There will be no other posts placed along the barn wall.

Eight posts are needed to complete the fence. Using the Base Angle Converse Theorem, I know the length of side AC is equal to the length of side BC. She will need four more posts for side AC and four more posts for side BC.

18. Given rectangle ACDE, calculate the measure of \( \angle CDB \).

The measure of \( m\angle CDB = 60^\circ \). Using the Base Angle Theorem, \( m\angle BDE = 30^\circ \). Since ACDE is a rectangle, \( m\angle CDE = 90^\circ \). So \( m\angle CDB = m\angle CDE - m\angle BDE = 90^\circ - 30^\circ = 60^\circ \).
Congruence Theorems in Action
Isosceles Triangle Theorems

Vocabulary

Choose the term from the box that best completes each sentence.

1. A(n) __________________________ vertex angle is the angle formed by the two congruent legs in an isosceles triangle.

2. In an isosceles triangle, the altitudes to the congruent sides are congruent, as stated in the ______ Isosceles Triangle Altitude to Congruent Sides Theorem ______.

3. In an isosceles triangle, the angle bisectors to the congruent sides are congruent, as stated in the ______ Isosceles Triangle Angle Bisector to Congruent Sides Theorem ______.

4. The ______ Isosceles Triangle Perpendicular Bisector Theorem ______ states that the altitude from the vertex angle of an isosceles triangle is the perpendicular bisector of the base.

5. The ______ Isosceles Triangle Base Theorem ______ states that the altitude to the base of an isosceles triangle bisects the base.

6. The altitude to the base of an isosceles triangle bisects the vertex angle, as stated in the ______ Isosceles Triangle Vertex Angle Theorem ______.
Problem Set

Write the theorem that justifies the truth of each statement.

1. In isosceles \( \triangle MRG \), \( RD \cong GC \).

2. In isosceles \( \triangle TGC \) with altitude \( TP \), \( TP \perp GC \), and \( GP \cong CP \).

3. In isosceles \( \triangle BRU \) with altitude \( BD \), \( UD \cong RD \).

4. In isosceles \( \triangle JFI \) with altitude \( JH \), \( \angle HJF \cong \angle HJI \).

5. In isosceles \( \triangle MNO \), \( OA \cong NB \).

6. In isosceles \( \triangle HJK \), \( KN \) bisects \( \angle HKJ \), \( JM \) bisects \( \angle HKJ \), and \( MJ \cong NK \).
Determine the value of $x$ in each isosceles triangle.

7. \( \triangle ABC \)
   \[ \angle B = 32^\circ \]
   \[ \text{Base} = 8 \text{ in.} \]
   \[ \text{Height} = 8 \text{ in.} \]
   \[ x = 32^\circ \]

8. \( \triangle KWP \)
   \[ \text{Sides} = 25 \text{ m} \]
   \[ \text{Base} = 24 \text{ m} \]
   \[ x = 24 \text{ m} \]

9. \( \triangle PMN \)
   \[ \text{Sides} = 20 \text{ ft} \]
   \[ \text{Height} = 26 \text{ ft} \]
   \[ x = 13 \text{ ft} \]

10. \( \triangle STU \)
    \[ \text{Sides} = 16 \text{ m} \]
    \[ \text{Height} = 4 \text{ m} \]
    \[ x = 8 \text{ m} \]

11. \( \triangle VWU \)
    \[ \text{Sides} = 10 \text{ cm} \]
    \[ \text{Height} = 12 \text{ cm} \]
    \[ x = 10 \text{ cm} \]

12. \( \triangle PRQ \)
    \[ \text{Sides} = 29 \text{ yd} \]
    \[ \angle R = 37^\circ \]
    \[ x = 37^\circ \]
Complete each two-column proof.

13. Given: Isosceles \( \triangle ABC \) with \( AB \cong CB \),

Use the given information to answer each question.

17. The front of an A-frame house is in the shape of an isosceles triangle, as shown in the diagram. In the
diagram, $HK \perp GJ, GH \equiv JH$, and $m\angle HGJ = 68.5^\circ$. Use this information to determine the measure of
$\angle GHJ$. Explain.

The measure of $\angle GHJ$ is $43^\circ$.

By the Triangle Sum Theorem, $m\angle GHK = 180^\circ - (90^\circ + 68.5^\circ) = 21.5^\circ$.

By the Isosceles Triangle Vertex Angle Theorem, $m\angle GHK = m\angle JHK$.
Therefore, $m\angle GHJ = 21.5^\circ + 21.5^\circ = 43^\circ$.

18. When building a house, rafters are used to support the roof. The rafter shown in the diagram
has the shape of an isosceles triangle. In the diagram, $NP \perp RQ, NR \equiv NQ, NP = 12$ feet, and
$RP = 16$ feet. Use this information to determine the length of $NQ$. Explain.

The length of $NQ$ is 20 feet.

By the Isosceles Triangle Perpendicular Bisector Theorem, $\overline{RP}$ and $\overline{QP}$ have the same length.
Using the Pythagorean Theorem with $NP = 12$ feet and $QP = 16$ feet:

\[
(NP)^2 + (QP)^2 = (NQ)^2
\]
\[
12^2 + 16^2 = (NQ)^2
\]
\[
400 = (NQ)^2
\]
\[
20 = NQ
\]
19. Stained glass windows are constructed using different pieces of colored glass held together by lead. The stained glass window in the diagram is rectangular with six different colored glass pieces represented by \( \triangle TBS, \triangle PBS, \triangle PBQ, \triangle QBR, \triangle NBR, \) and \( \triangle NBT \). Triangle \( TBP \) with altitude \( SB \) and \( \triangle QBN \) with altitude \( RB \), are congruent isosceles triangles. If the measure of \( \angle NBR \) is 20°, what is the measure of \( \angle STB \)? Explain.

The measure of \( \angle STB \) is 70°.

Since \( \triangle TBP \) and \( \triangle QBN \) are congruent isosceles triangles, \( \angle TBP \equiv \angle QBN \). Altitudes \( SB \) and \( RB \) each bisect the vertex angle of the triangle, creating four congruent angles. In \( \triangle STB \), the measure of \( \angle TSB \) is 90°. By CPCTC, the measure of \( \angle SBT \) is 20°. By the Triangle Sum Theorem, 
\[
\angle STB = 180° - (90° + 20°) = 70°.
\]

20. While growing up, Nikki often camped out in her back yard in a pup tent. A pup tent has two rectangular sides made of canvas, and a front and back in the shape of two isosceles triangles also made of canvas. The zipper in front, represented by \( MG \) in the diagram, is the height of the pup tent and the altitude of isosceles \( \triangle EMH \). If the length of \( EG \) is 2.5 feet, what is the length of \( HG \)? Explain.

The length of \( HG \) is 2.5 feet.

Since \( MG \) is the altitude of isosceles \( \triangle EMH \), by the Isosceles Triangle Perpendicular Bisector Theorem, \( EG \equiv HG \). Therefore \( HG = 2.5 \) feet.
21. A beaded purse is in the shape of an isosceles triangle. In the diagram, \( \overline{TN} \cong \overline{TV}, \overline{VM} \perp \overline{TN} \), and \( \overline{NU} \perp \overline{TV} \). How long is the line of beads represented by \( \overline{NU} \), if \( TV \) is 13 inches and \( TM \) is 5 inches? Explain.

By the Isosceles Triangle Altitude to Congruent Sides Theorem, \( \overline{NU} \) and \( \overline{VM} \) have the same length. The line of beads represented by \( \overline{NU} \) is 12 inches long.

Using the Pythagorean Theorem with \( TV = 13 \) inches and \( TM = 5 \) inches:

\[
(VM)^2 + (TM)^2 = (TV)^2
\]
\[
(VM)^2 + 5^2 = 13^2
\]
\[
(VM)^2 + 25 = 169
\]
\[
(VM)^2 = 144
\]
\[
VM = 12
\]
22. A kaleidoscope is a cylinder with mirrors inside and an assortment of loose colored beads. When a person looks through the kaleidoscope, different colored shapes and patterns are created as the kaleidoscope is rotated. Suppose that the diagram represents the shapes that a person sees when they look into the kaleidoscope. Triangle $AEI$ is an isosceles triangle with $AE \cong AI$. $EK$ bisects $\angle AEI$ and $IC$ bisects $\angle AIE$. What is the length of $IC$, if one half the length of $EK$ is 14 centimeters? Explain.

The length of $IC$ is 28 centimeters.

By the Isosceles Triangle Angle Bisector to Congruent Sides Theorem, $IC$ and $EK$ are congruent. Since half the length of $EK$ is 14 centimeters, its full length is 28 centimeters. Therefore, the length of $EK$ is 28 centimeters. So, the length of $IC$ is 28 centimeters.
Making Some Assumptions
Inverse, Contrapositive, Direct Proof, and Indirect Proof

Vocabulary
Define each term in your own words.

1. inverse
   The inverse of the conditional statement “If \( p \), then \( q \),” is the statement “If not \( p \), then not \( q \).”

2. contrapositive
   The contrapositive of the conditional statement “If \( p \), then \( q \),” is the statement “If not \( q \), then not \( p \).”

3. direct proof
   A direct proof is a proof that begins with the given information and works to the desired conclusion directly through the use of givens, definitions, properties, postulates, and theorems.

4. indirect proof (or proof by contradiction)
   An indirect proof, or proof by contradiction, is a proof that uses the contrapositive. If you prove the contrapositive true, then the statement is true.

5. Hinge Theorem
   If two sides of one triangle are congruent to two sides of another triangle, and the included angle of the first pair is larger than the included angle of the second pair, then the third side of the first triangle is longer than the third side of the second triangle.

6. Hinge Converse Theorem
   If two sides of one triangle are congruent to two sides of another triangle, and the third side of the first triangle is longer than the third side of the second triangle, then the included angle of the first pair of sides is larger than the included angle of the second pair of sides.
Problem Set

Write the converse of each conditional statement. Then, determine whether the converse is true.

1. If two lines do not intersect and are not parallel, then they are skew lines.
   The converse of the conditional would be:
   If two lines are skew lines, then they do not intersect and are not parallel.
   The converse is true.

2. If two lines are coplanar and do not intersect, then they are parallel lines.
   The converse of the conditional would be:
   If two lines are parallel lines, then they are coplanar and do not intersect.
   The converse is true.

3. If a triangle has one angle whose measure is greater than 90º, then the triangle is obtuse.
   The converse of the conditional would be:
   If a triangle is obtuse, then the measure of one of its angles is greater than 90º.
   The converse is true.

4. If a triangle has two sides with equal lengths, then it is an isosceles triangle.
   The converse of the conditional would be:
   If a triangle is an isosceles triangle, then it has two sides with equal lengths.
   The converse is true.

5. If the lengths of the sides of a triangle measure 5 mm, 12 mm, and 13 mm, then it is a right triangle.
   The converse of the conditional would be:
   If a triangle is a right triangle, then the lengths of its sides are 5 mm, 12 mm, and 13 mm.
   The converse is not true.
6. If the lengths of the sides of a triangle are 3 cm, 4 cm, and 5 cm, then the triangle is a right triangle.
   The converse of the conditional would be:
   If a triangle is a right triangle, then the lengths of its sides are 3 cm, 4 cm, and 5 cm.
   The converse is not true.

7. If the corresponding sides of two triangles are congruent, then the triangles are congruent.
   The converse of the conditional would be:
   If two triangles are congruent, then the corresponding sides of the two triangles are congruent.
   The converse is true.

8. If the corresponding angles of two triangles are congruent, then the triangles are similar.
   The converse of the conditional would be:
   If two triangles are similar, then the corresponding angles of the two triangles are congruent.
   The converse is true.

Write the inverse of each conditional statement. Then, determine whether the inverse is true.

9. If a triangle is an equilateral triangle, then it is an isosceles triangle.
   The inverse of the conditional would be:
   If a triangle is not an equilateral triangle, then it is not an isosceles triangle.
   The inverse is not true.

10. If a triangle is a right triangle, then the sum of the measures of its acute angles is 90°.
    The inverse of the conditional would be:
    If a triangle is not a right triangle, then the sum of the measures of its acute angles is not 90°.
    The inverse is true.
11. If the sum of the internal angles of a polygon is 180°, then the polygon is a triangle.
   The inverse of the conditional would be:
   If the sum of the internal angles of a polygon is not 180°, then the polygon is not a triangle.
   The inverse is true.

12. If a polygon is a triangle, then the sum of its exterior angles is 360°.
   The inverse of the conditional would be:
   If a polygon is not a triangle, then the sum of its exterior angles is not 360°.
   The inverse is not true.

13. If two angles are the acute angles of a right triangle, then they are complementary.
   The inverse of the conditional would be:
   If two angles are not the acute angles of a right triangle, then they are not complementary.
   The inverse is not true.

14. If two angles are complementary, then the sum of their measures is 90°.
   The inverse of the conditional would be:
   If two angles are not complementary, then the sum of their measures is not 90°.
   The inverse is true.

15. If a polygon is a square, then it is a rhombus.
   The inverse of the conditional would be:
   If a polygon is not a square, then it is not a rhombus.
   The inverse is not true.

16. If a polygon is a trapezoid, then it is a quadrilateral.
   The inverse of the conditional would be:
   If a polygon is not a trapezoid, then it is not a quadrilateral.
   The inverse is not true.
Write the contrapositive of each conditional statement. Then, determine whether the contrapositive is true.

17. If one of the acute angles of a right triangle measures 45°, then it is an isosceles right triangle.
   The contrapositive of the conditional would be:
   If a triangle is not an isosceles right triangle, then it is not a right triangle with an acute angle that measures 45°.
   The contrapositive is true.

18. If one of the acute angles of a right triangle measures 30°, then it is a 30°–60°–90° triangle.
   The contrapositive of the conditional would be:
   If a triangle is not a 30°–60°–90° triangle, then it is not a right triangle with an acute angle that measures 30°.
   The contrapositive is true.

19. If a quadrilateral is a rectangle, then it is a parallelogram.
   The contrapositive of the conditional would be:
   If a quadrilateral is not a parallelogram, then it is not a rectangle.
   The contrapositive is true.

20. If a quadrilateral is an isosceles trapezoid, then it has two pairs of congruent base angles.
   The contrapositive of the conditional would be:
   If a quadrilateral does not have two pairs of congruent base angles, then it is not an isosceles trapezoid.
   The contrapositive is true.
21. If the sum of the measures of two angles is 180°, then the angles are supplementary.
   The contrapositive of the conditional would be:
   If two angles are not supplementary, then the sum of their measures is not 180°.
   The contrapositive is true.

22. If two angles are supplementary, then the sum of their measures is 180°.
   The contrapositive of the conditional would be:
   If the sum of the measures of two angles is not 180°, then the angles are not supplementary.
   The contrapositive is true.

23. If the radius of a circle is 8 meters, then the diameter of the circle is 16 meters.
   The contrapositive of the conditional would be:
   If the diameter of a circle is not 16 meters, then the radius of the circle is not 8 meters.
   The contrapositive is true.

24. If the diameter of a circle is 12 inches, then the radius of the circle is 6 inches.
   The contrapositive of the conditional would be:
   If the radius of a circle is not 6 inches, then the diameter of the circle is not 12 inches.
   The contrapositive is true.
Create an indirect proof to prove each statement.

28. Given: \( ET \cong DT \) and \( EU \neq DU \)
Prove: \( EX \neq DX \)

Paragraph Proof:
You are given that \( ET \cong DT \) and \( EU \neq DU \). Begin by assuming that \( EX \cong DX \). By the Reflexive Property of Congruence, \( TX \cong TX \) and \( UX \cong UX \). By the SSS Congruence Theorem, \( \triangle ETX \cong \triangle DXU \). By CPCTC, \( \angle EXT \cong \angle DXU \). By the Vertical Angles Theorem, \( \angle EXU \cong \angle DXU \) and \( \angle TXD \cong \angle EXU \). Using the Transitivity Property of Congruence, \( \angle EXU \cong \angle DXU \). By the SAS Congruence Theorem, \( \triangle EXU \cong \triangle DXU \). As a result, CPCTC justifies the conclusion that \( \overline{EU} \cong \overline{DU} \), which contradicts the given information \( \overline{EU} \neq \overline{DU} \), so the assumption is false. Therefore, by contradiction, \( EX \neq DX \).
For each pair of triangles, use the Hinge Theorem or its converse to write a conclusion using an inequality,

29. \[ \triangle SPG \] \[ \triangle QHG \]
\[ SP > GQ \]

30. \[ \triangle ADX \] \[ \triangle RQX \]
\[ AD > RQ \]

31. \[ \triangle PQR \] \[ \triangle TAE \]
\[ m\angle E > m\angle T \]

32. \[ \triangle XYZ \] \[ \triangle KUZ \]
\[ m\angle Z > m\angle I \]
